

## AMENDMENTS TO THE CLAIMS

Claims 1-17 (Cancelled).

18. (New) A substrate processing apparatus, comprising:  
a substrate holder for holding and rotating a substrate substantially horizontally;  
a supply nozzle having an open end for supplying a processing liquid onto a peripheral portion of an upper surface of the substrate which is to be rotated; and  
a suction nozzle having a suction mouth for sucking the processing liquid on the peripheral portion of the upper surface of the substrate, said suction mouth of said suction nozzle being located at the same radial distance from a center point of the substrate as said open end of said supply nozzle, and said suction mouth of said suction nozzle being located adjacent to said open end of said supply nozzle;  
wherein said substrate holder is operable to rotate the substrate at a speed low enough to allow the supplied processing liquid to remain stationary on the upper surface of the substrate during rotation of the substrate.

19. (New) The substrate processing apparatus according to claim 18, wherein said substrate holder is operable to rotate the substrate at a speed of not more than  $500 \text{ min}^{-1}$ .

20. (New) The substrate processing apparatus according to claim 18, wherein said substrate holder is operable to rotate the substrate at a speed in a range of  $5 \text{ min}^{-1}$  to  $200 \text{ min}^{-1}$ .

21. (New) The substrate processing apparatus according to claim 18, wherein a distance between said open end of said supply nozzle and the upper surface of the substrate is not more than 5 mm.

22. (New) The substrate processing apparatus according to claim 18, wherein said supply nozzle is shaped and arranged such that a flow rate of the processing liquid supplied through said open end of said supply nozzle is not more than 100 ml/min.

23. (New) The substrate processing apparatus according to claim 18, wherein said supply nozzle and said suction nozzle are adjacent to each other.

24. (New) The substrate processing apparatus according to claim 18, further comprising a gas-liquid separator coupled to said suction nozzle for separating the sucked processing liquid from a gas.

25. (New) The substrate processing apparatus according to claim 24, further comprising a recovery unit for recovering the processing liquid which has been separated by said gas-liquid separator, and to supply the recovered processing liquid to said supply nozzle.

26. (New) The substrate processing apparatus according to claim 18, wherein said supply nozzle comprises a first supply nozzle having said open end, further comprising a second supply nozzle having an open end;

wherein said suction nozzle comprises a first suction nozzle having said suction mouth, further comprising a second suction nozzle having a suction mouth;

wherein said first supply nozzle and said second supply nozzle are arranged symmetrically about the center point of the substrate; and

wherein said first suction nozzle and said second suction nozzle are arranged symmetrically about the center point of the substrate.

27. (New) The substrate processing apparatus according to claim 26, wherein said first supply nozzle and said second suction nozzle are adjacent to each other; and

wherein said second supply nozzle and said first suction nozzle are adjacent to each other.

28. (New) The substrate processing apparatus according to claim 18, wherein said supply nozzle comprises a first supply nozzle having said open end, further comprising a second supply nozzle having an open end, said second supply nozzle being arranged so as to extend in a direction perpendicular to a direction of extension of said first supply nozzle, and arranged so that said open end of said second supply nozzle faces a peripheral edge of the substrate.

29. (New) The substrate processing apparatus according to claim 18, wherein said suction mouth of said suction nozzle is located at a position forward of said open end of said supply nozzle with respect to a rotational direction of the substrate.

30. (New) The substrate processing apparatus according to claim 18, wherein said supply nozzle, said suction nozzle, and said substrate holder are arranged such that a travel distance of a reference point located on the peripheral portion of the upper surface of the substrate to be rotated by said substrate holder is greater when traveling from a location at which the reference point is located adjacent to said open end of said supply nozzle to a location at which the reference point is located adjacent to said suction mouth than a travel distance of the reference point when traveling from a location at which the reference point is located adjacent to said suction mouth of said suction nozzle to a location at which the reference point is located adjacent to said open end of said supply nozzle.
